Celebrating
YEARS
50
OF Successful
TOLL ROAD PROJECTS

An aerial photograph of a multi-lane highway. On the left, a large concrete bridge spans across a deep valley. The road continues through a lush green landscape with rolling hills and dense forests. Several vehicles, including a white truck and several cars, are visible on the road. The sky is clear and blue. The image is overlaid with a large green circular graphic on the right side.

Anticipating the transition towards alternative fuels

HOSTED BY
AISIFIINIAIG

The French toll road network

ASFA

9 221 km of toll motorway network and toll facilities

91,5 billion kilometres travelled per year

21 concessionaires

11 969 employees

294 service areas equipped with fast electrical charging stations in December 2022 (80%)

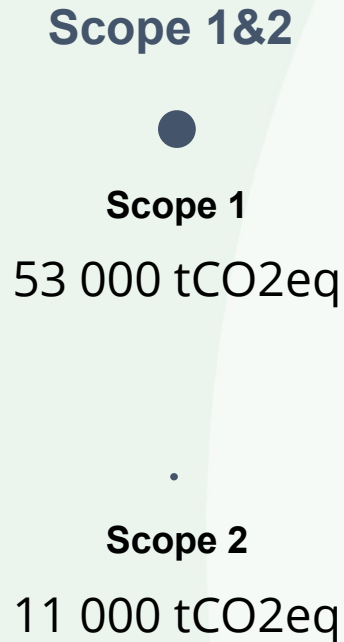

131 parking areas for carpooling

1817 wildlife crossing structures

CO₂ emissions, French toll roads

Traffic

🚗 : 16.2 million tCO₂
🚛 : 12.3 million tCO₂

29 million tCO₂eq
~7% of France's emissions

Scope 3

Operations
(service areas, electricity...)

377 000 tCO₂eq

Maintenance and investment in the network

175 000 tCO₂eq

French motorway emissions for 2022 ; categories according to Greenhouse Gas Protocol (GHG)

CO₂ emissions, French toll roads

Assessing accurately traffic emissions – scope 3

The evaluation requires an integrated model, using:

- LV/HV traffic, average load factor for heavy goods vehicles
- Vehicle fleet characterization - energy, age, weight...
- Other factors affecting vehicle kinematics:
 - Local speed limits (90 km/h -> 130 km/h)
 - Yearly traffic conditions: breakdown between fluid, dense, saturated and Stop&Go hkm
 - Presence of speed cameras, toll gates
 - Road gradients (longitudinal slopes) on the network

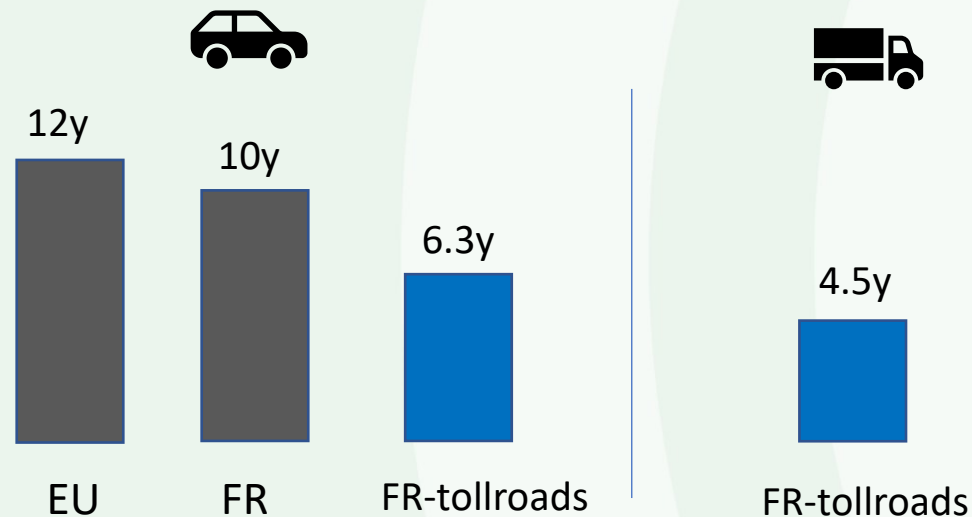

→ Need for precise and up-to-date data **concerning fleet characterization**

→ An ASFA study in the summer 2022: over 100 000 vehicles analysed at 23 points on the French network

2022 fleet study

High rate of fleet renewal on the motorway network

Average age of vehicles:

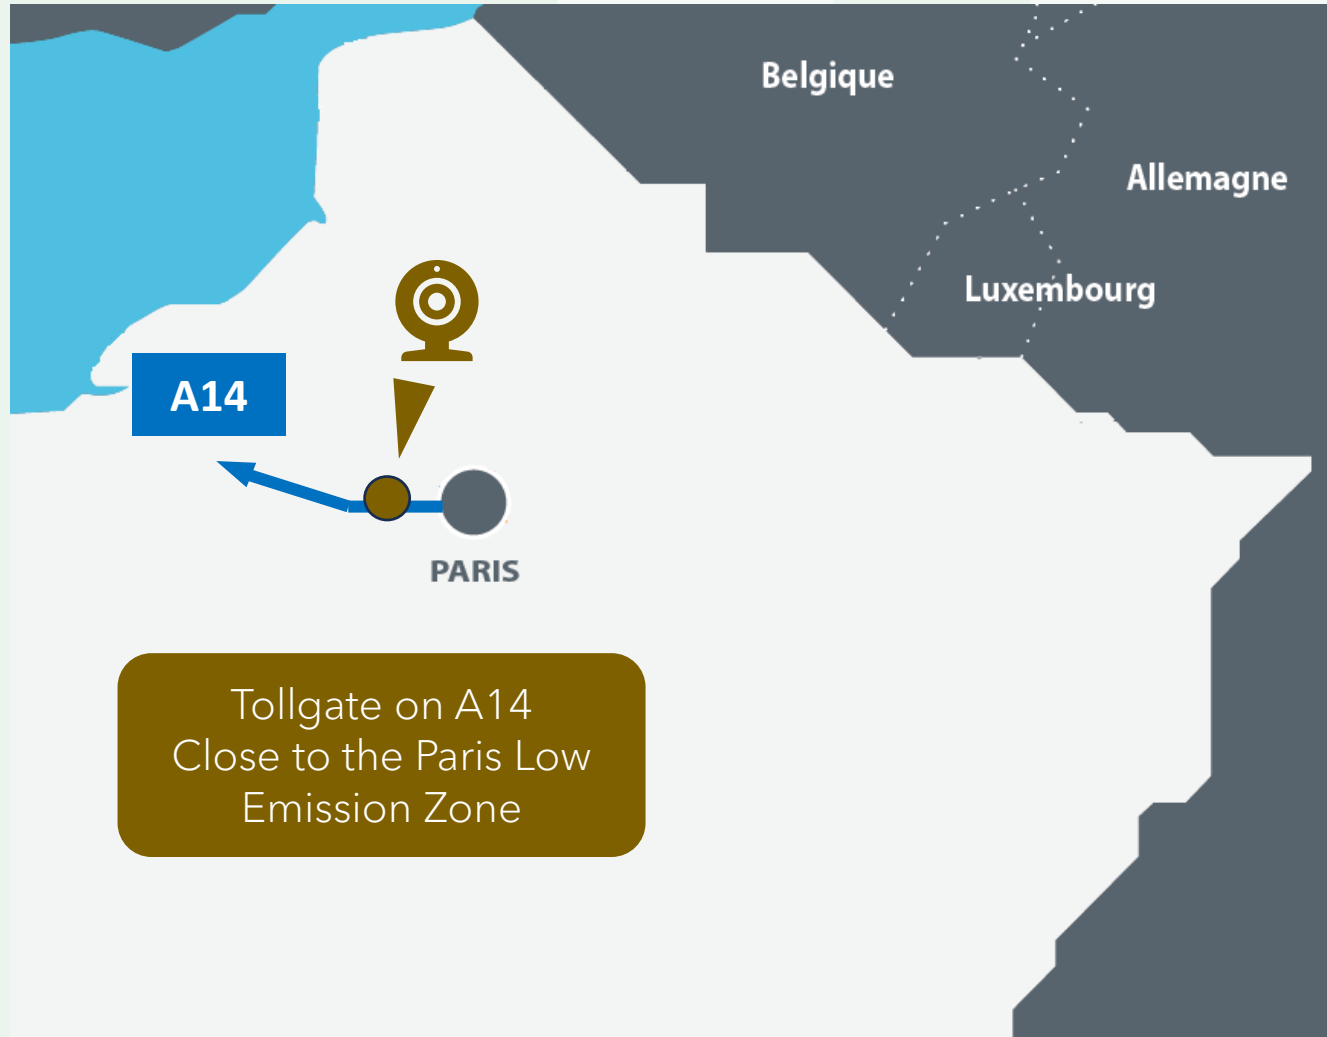

- Vehicles are recent nevertheless an “ageing process” is underway since COVID (decline in sales)

→ Vehicles used for occasional trips are older than those used on working days.

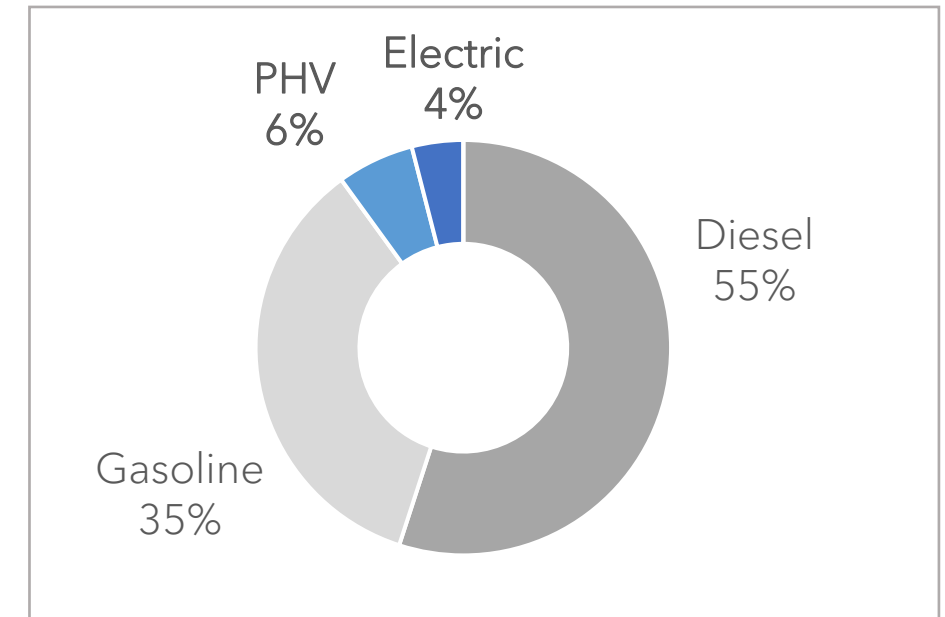

→ The average age of the car fleet varies substantially from one site to another and from one day to the next.

2022 fleet study

Geographical disparities – Paris Low Emission Zone

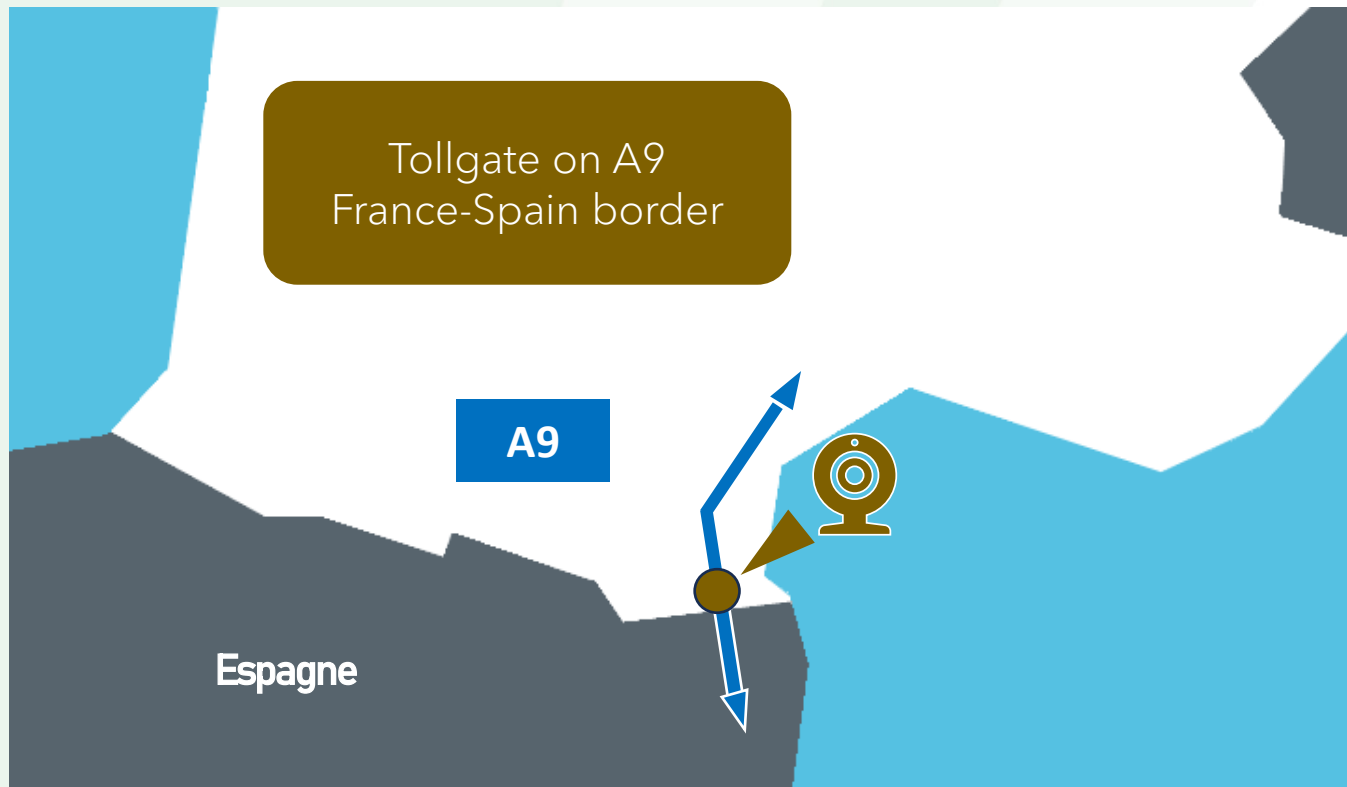

- Average age, LV, working days: 4.5 y
- Average age, LV, week-end: 7.6 y
- Energy mix:

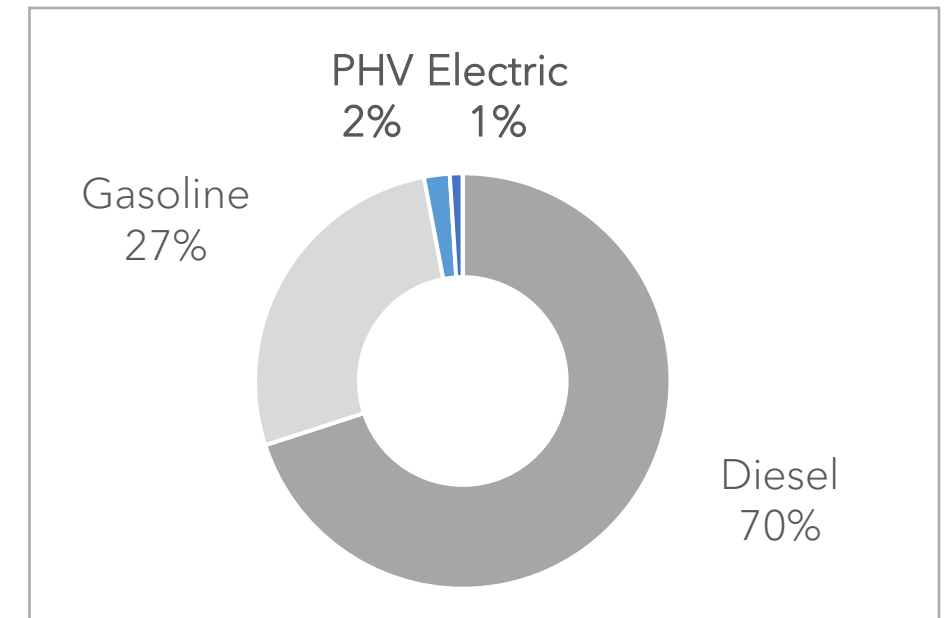

2022 fleet study

Geographical disparities – cross-border traffic

- Average age, LV, working days: 7.2 y
- Average age, LV, week-end: 7.6 y
- Energy mix:

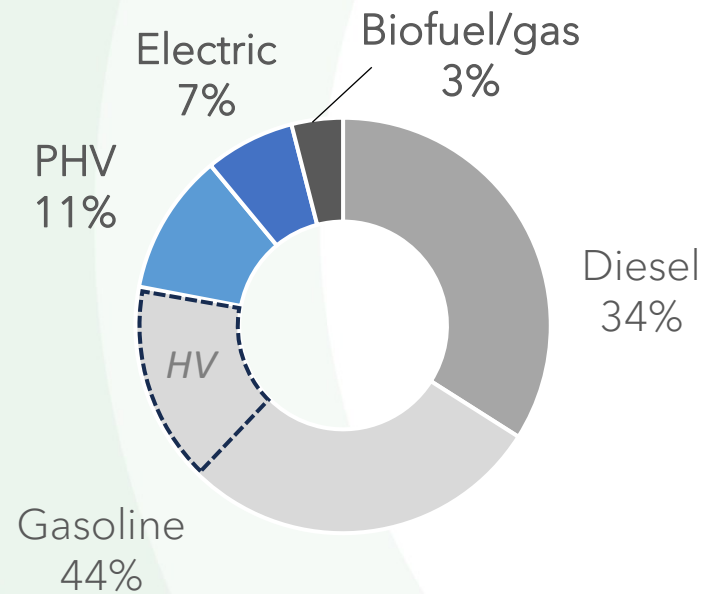

2022 fleet study

Alternative fuels progression

ASFA
average

ASFA
vehicles gone into service in 2022

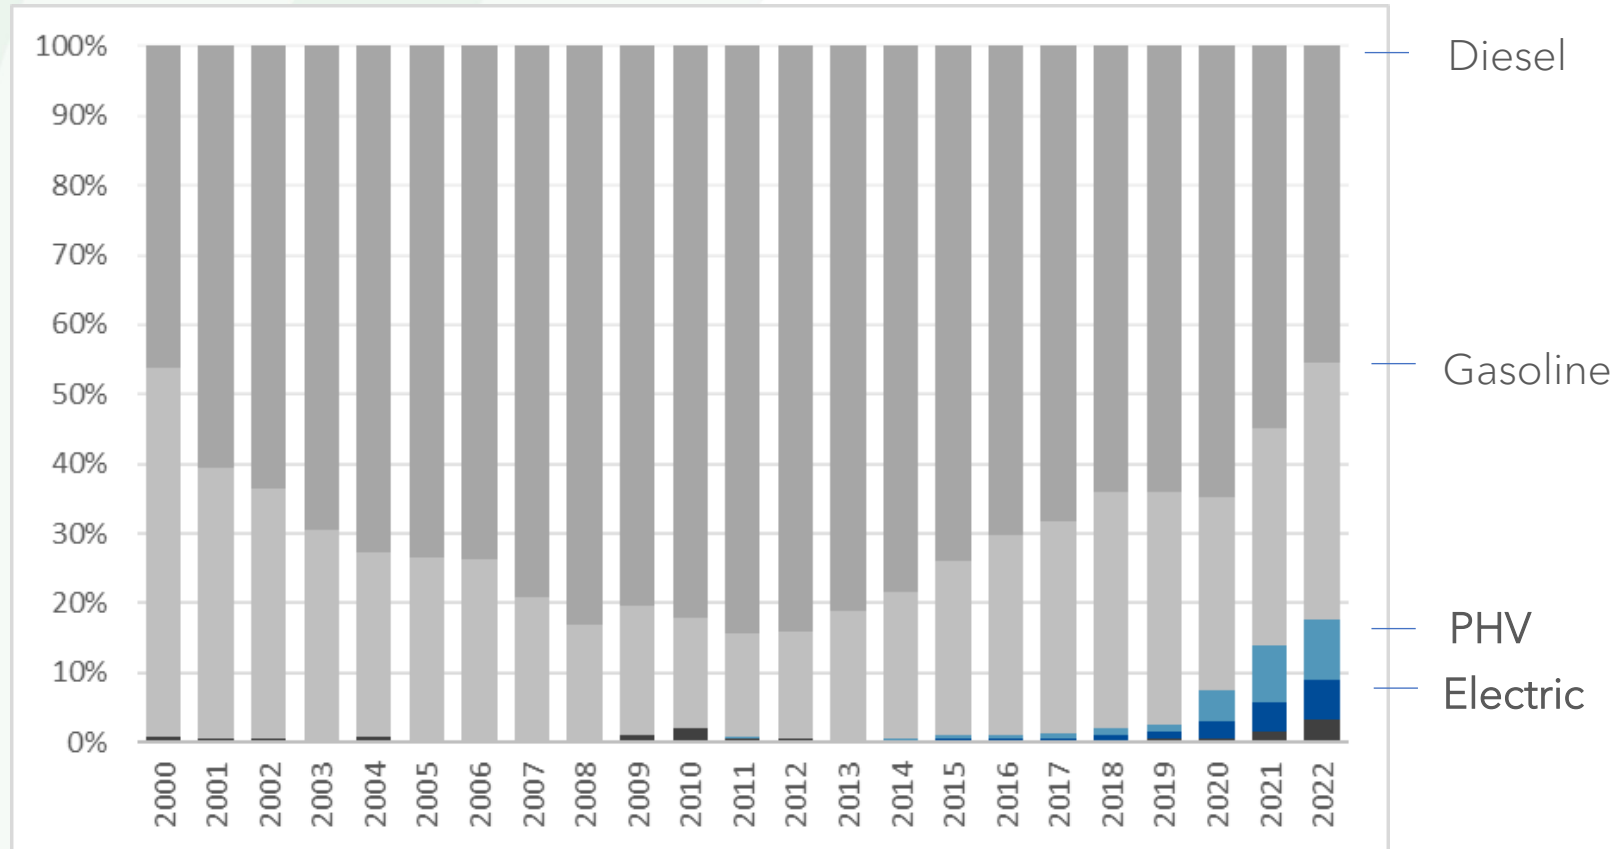

A14 / Paris LEZ
vehicles gone into service in 2022

2022 fleet study

Alternative fuels - LV

Share of different energies in the LV fleet according to the year the vehicles went into service.

2022 fleet study

Alternative fuels - HV

Share of different energies in the HV fleet according to the year the vehicles went into service.

Supporting the transition towards alternative fuels

- **294 service areas on the network equipped with fast charging stations for light vehicles in December 2022 (80%)**
- **1553 charging points, 78% of them delivering power over 150 kW**
- **One service area available every 60 km in average**

Comprehensive plan to cover all service areas this year

Thank you for your attention
